

Question

Why do I get intermittent failures when I try and upload to repositories on Docker Hub?

Answer

This can sometimes occur due to DNS resolution problems on the client machine. Try changing the default DNS servers in `/etc/resolv.conf` to use Google's public DNS resolvers:

```
nameserver 8.8.8.8  
nameserver 8.8.4.4
```

If this resolves the issue then additional investigation of the original DNS servers may be needed.
